#### **DETAILS**

## Name

P SANIYA

**Roll Number** 

3BR23EC118

### **EXPERIMENT**

**Title** 

ENCODE THE NUMBER

#### Description

You work in the message encoding department of a national security agency. Every message that is sent from or received in your office is encoded. You have an integer N, and each digit of N is squared and the squares are concatenated together to encode the original number. Your task is to find and return an integer value representing the encoded value of the number.

**input1:** An integer value N representing the number to be encoded.

2236

#### **Output:**

Return an integer value representing the encoded value of the number.

Sample Input:

167

Sample Output:

13649

#### Source Code:

```
def encode_number(N):
    str_N = str(N)
    encoded_str = ""
    for digit in str_N:
        squared_digit = int(digit)**2
        encoded_str += str(squared_digit)
        encoded_value = int(encoded_str)
    return encoded_value
N = int(input())
result = encode_number(N)
print(result)
```
